"A substantial body of evidence exists which points to serious and potentially ill-health effects of 5 α -RIs' therapy. These include loss or reduced libido, erectile dysfunction, orgasmic and ejaculatory dysfunction (Table 2) [99], development of high grade PCa tumors (Fig. 4), potential negative cardiovascular events, and depression. The side effects are potentially harmful in some individuals and in young men may be persistent or irreversible [100]. The argument that the benefits of these drugs outweighs the risks is slowly eroding in the face of new emerging scientific evidence from preclinical (Figs. 2, ,3;3; Table 1) and clinical studies (Table 2)."
