Most people go bald and have little knowledge about possible solutions.

Obviously hair restoration is a very good solution, however it is limited by the amount of donor hairs available. Most bald men stage Norwood 6+ have too little donor supply to achieve a good result.

Then of course there are hair pieces to cover the balding area, but not everybody likes the idea.

The latest solution for bald men is Tricopigmentation. This is a refined form of micro hair pigmentation where hair stubbles are created using special pigments, special needles. Many think about tattoo, and indeed by looking at the technician treating a patient it looks like a tattoo session.

However, Tricopigmentation shares no technical methods with tattoo.

Tricopigmentation is much more refined, and is created for the sole purpose of hair pigmentation.

Here is a good example of what can be achieved after just 2 session of Tricopigmentation.
