---

"ASCJ is synthesized from a natural product and promotes the degradation of endogenous androgen receptors. This pharmacological mechanism differs completely from all currently available anti-androgens. In laboratory tests, topically applied testosterone induced inhibition of the hair cycle progression with prolongation of the telogen phase 50% of the time in the mouse model. Whereas anagen conversion was achieved in 100% of the mice given testosterone followed with ASCJ-9. The researchers concluded, "These preliminary observations suggest that ASCJ-9 is a potential candidate for effective and safe topical treatment of acne and male pattern baldness."\*

Nichts. Ist zu teuer zum Selbertesten, und Selberherstellen ist zudem sehr schwierig.

schau mer mal

es färbt höllisch.....aber es gebe noch ein farbloses derivat

es haben es paar amis getestet..von einem wunder noch nix gehört

danke fürs posten, die sache ist trotzdem interessant...weil

Zitat: a bacterium found naturally on the scalp, to secrete 3 $\beta$ -hydroxysteroid dehydrogenase, an enzyme that breaks down DHT

nur das 3 $\beta$ -hsd baut das DHT zu androstanediol um

und das könnte das haar eventuell noch schneller ausfallen lassen
